Abstract of EP0844007 (A2)

The container inside the main body (2) has at least one storage place (9) for the medium pre-measured-out into at least one separate single portion in a compartment (17). A dispenser (1) conveys the single portion through an outlet (12) via a fluid-guide (14). At least part of the pre-measured-out portion can be transferred to, and stored in, an intermediate store (21). In front of the outlet is a mill (20) formed partly at least by a flow-accelerator, vortex generator, impact surface (27) or sieve (48). Between the storage place and the intermediate store is at least one drop or downward dropping track (22,23).
